

Comparative Analysis

Computer Networks

Name: Sushmitha

Reg No: 1972260028 

TITLE :TCP vs UDP

TCP	UDP
Connection oriented	Connectionless
Reliable	Faster
Uses ACK & Sequence number	No ACK & sequence number
Larger header	Smaller header
Used when reliability is important	Used when speed important

TCP provides reliability, while UDP provides faster communication 

Traffic Shaping vs Traffic Policing

Traffic Shaping	Traffic Policing
Smooths traffic flow	Controls traffic rate
Buffers extra packets	Drops or marks extra packets
Reduces traffic bursts	Enforces traffic limit
Improves smooth performance	Prevents excess traffic

Shaping smooth traffic, while policing limits excess traffic.

Priority Queue vs Normal Queue

Priority Queue	Normal Queue
High priority packets go first	Packets go in normal order
Important traffic gets faster service	All packets get equal treatment
Useful for real time traffic	Suitable for normal traffic
Improves QOS for important data	May cause delay for important data

Priority Queue gives faster service to important traffic and improves QOS.
